

# STUDENT REPORT

## DETAILS

Name

B BASAVARAJA REDDY

Roll Number

KUB23CSE015

## EXPERIMENT

Title

NUMBER OF COMBINATIONS LEADING TO A PRODUCT

Description

Problem Statement:

You are given an array arr and a product m. Your task is to find the number of possible unique triplets whose product of elements is m.

Input Format:

- The first line contains the integer, n
- The second line contains space separated integers of the array, arr
- The third line contains the product m.

The input will be read from the STDIN by the candidate

Output Format:

The output consists of a single integer, i.e. the count of unique triplets having product m.

The output will be matched to the candidate's output printed on the STDOUT

Example:

Input:

7  
5 3 20 10 1 4 2  
60

Output:

3

Explanation:

Product m:60

Possible triplets for product m: (5,4,3),(20,3,1), (10,3,2)

The count of unique triplets is 3.

Source Code:

```
def count_triplets_with_product(arr, n, m):  
    count = 0  
  
    # Check every combination of triplets  
    for i in range(n):  
        for j in range(i + 1, n):  
            for k in range(j + 1, n):  
                # If the product of triplet is equal to m  
                if arr[i] * arr[j] * arr[k] == m:  
                    count += 1  
  
    return count  
  
n = int(input()) # Read the size of the array  
arr = list(map(int, input().split())) # Read the array elements  
m = int(input()) # Read the target product  
  
# Output the result  
print(count_triplets_with_product(arr, n, m))
```

## RESULT

6 / 6 Test Cases Passed | 100 %
